

## Toolbar2

This extension is equal to the eZToolbar but stores its items in the DB. You can reach the management via Design -> Toolbar2 management in the admin interface.

You will get this screen where you can select a siteaccess you want to configure the tools for. If you change the siteaccess in the dropdown box please push the "SET" button below the list. If the siteaccess is set you can choose between the toolbar positions "right" and "left". The positions are defined in an ini-file so we can add or rename them.

SiteAccess:

est  
msn  
est\_admin  
est\_nocache

**Available EST toolbars for the <est> siteaccess**

right  
left

## Tool2 List

If you clicked the link „right“ for the siteaccess est you get the list of all configured tools with an overview of the configured rules. In this case I added the tool "relatedlinks" with two rules. Sorted by priority. The rules are processed from the top to the bottom. You can add a tool by selecting a tool from the drop down box and clicking the "Add Tool" button on the bottom. If a tool is already added it will not appear in the drop down box for available tools. If you want to add/remove/change the rules you have to click on the "Configure" button that is next to the name of the tool. On the right side of each tool you can find an input field for the priority. On the right bottom of the page you can find the "update priorities" button. If you click it the tools get sorted in the order of the priority.

## Rules

After you clicked on „Configure” you can see the screen below. The rules for the selected tool can be configured. To select a node you need to click on the “browse”-button. You get forwarded to a browse view where you can select one node. You can change the type (node / subtree) and decide if you want to include or exclude the node. Please click the “Apply changes” button to store your changes.

When you are done you can click the “Back to Tool List” button to get to the tool overview. To update the priorities you have to push the “Update Priorities” – button after you’ve changed them. To remove certain rules just mark the rules you want to delete and click the “Remove selected”-button.
